DETAILED ACTION

Claims included in the prosecution are 1-13.

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 6, 9 and 12-13 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 9 is a process of preparation claim and does not recite any process steps.

Are 5 compounds represented by figures are Markush members?

What is being conveyed by 'composition which is an injection' in claims 6, 12 and 13? Does applicant mean that the composition is in a form suitable for an injection?

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-2, 5-6 and 8 are rejected under 35 U.S.C. 102(b) as being anticipated by Kamps (BBA, 1996) of record.

Kamps discloses liposomes, which have both albumin and PEG, are bonded

(abstract, Materials and Methods). Instant claim 2 simply recites a physiologically active substance and therefore, the reference, which teaches the internalized buffer meets the requirements of instant claim.

5. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Panagi (International Journal of Pharmaceutics, 1999) of record.

Panagi teaches liposomes having both HAS and PEG on their surfaces (abstract and Figure).

6. Claims 1-13 are rejected under 35 U.S.C. 102(b) as being anticipated by Tardi (J. Immunological methods, 1997) of record.

Tardi discloses liposomes which have both ovalbumin and PEG on their surfaces. The liposomes further contain doxorubicin. Ovalbumin is modified with the amine reactive crosslinker SPDP according to the procedures of Loughery (using N- (3-(2-pyridyldithio) propionyl) phosphatidylethanolamine), which is cited of interest (abstract, Materials and Methods, Figure 1).
